

Press Release News 2023, Switzerland

New for 2023, Evnroll has refined and improved on its multi award-winning V-Series putter line to include interchangeable weights and a duo finish.

The V-Series putters offer golfers all the benefits of Evnroll's patented SweetFace Technology with ability to dial in their preferred swing weight.

EV5 Players Mallet – where tradition meets technology

Each putter design features a precision CNC milled 303 stainless steel face and front section along with a choice of three different models featuring 6061 aluminum back chassis.

- EV5.1 is an intuitive shape for the simplest aiming option with a standard single top sightline along with linear rear wings that curve back towards the center for macro aimers.
- EV5.2 offers a standard single top sightline and two cavity sightlines that draft off the rear center line for those players who prefer multiple sightlines in their setup process along with linear rear wing for macro aimers.
- EV5.3 provides a standard single top sightline coupled with a clean rear linear shape that provides a rectangle aiming window for both parallel and perpendicular aiming.

The EV5 series is offered in duo finish color. This color benefits from macro and micro parallel and perpendicular aiming through the use of dual color front and rear sections.

Tradition meets Technology

The duo finish color enhances the stainless steel front section to give it the feel of a blade putter. The rear aluminium chassis and four tungsten weights positioned deep and low offer the CG (center of gravity) and MOI (moment of inertia) benefits of a mallet.

Adjustable six-point weighting

The addition of six weight ports allows the golfer to balance the putter to his personal preferences.

Sweetface Technology

This patented face groove technology delivers consistent ball speeds from center and off-center hits with virtually zero dispersion for award-winning accuracy.

EV12 – MOI Mallet (full white)

The lightweight aluminium head is surrounded by the three times heavier steel wings. This increases the stability at impact significantly. The clear and simple alignment of the overall design makes the EV12 a game supporting mallet.
